## Issue

Customer was exporting the ARM template from the portal, and noticed there are no parameters present in ARM template for event based trigger. ADF is git enabled.

However, when customer download the ARM template for same pipeline in Data Factory mode, he was able to see parameters in ARM template.

## Resolution

This is most likely due to user having a custom parameterization file in their git repo (see cidcd custom parameters documentation: <https://docs.microsoft.com/en-us/azure/data-factory/continuous-integration-deployment#use-custom-parameters-with-the-resource-manager-template> [↗](#))

Please ask customer to verify if they have custom parameters file, if they do, verify they didn't modify the parameters definition (specifically the triggers section)
