

# Package execution failed with Login failed error using environment variable

Last updated by | Jackie Huang | Jan 4, 2022 at 12:24 AM PST

---

## SME

Hongxian Yao(hoyao)

## Symptoms

When customer uses environment variable to override the connection manager's connection string, the package executions sometimes fail with 'Login failed for user 'XXX''

## Kusto Query

AisOperationTraceEventV2 | where message contains 'Login failed for user'

## Keyword

Login fail; environment variable; connection manager

## Cause

The environment variable has included a password value in the connection string. However, the real password value for the connection string has been changed by the 'Password' property. Then user name and password may not match which causes the login failure.

## Resolution

Suggest customer not to include the password in the connection string and set a separate environment variable for the password. property.

## More Information

Reminder, best practice, how to avoid the issue, how to troubleshoot

## Sample cases
