

# PostgreSQL setup firewall

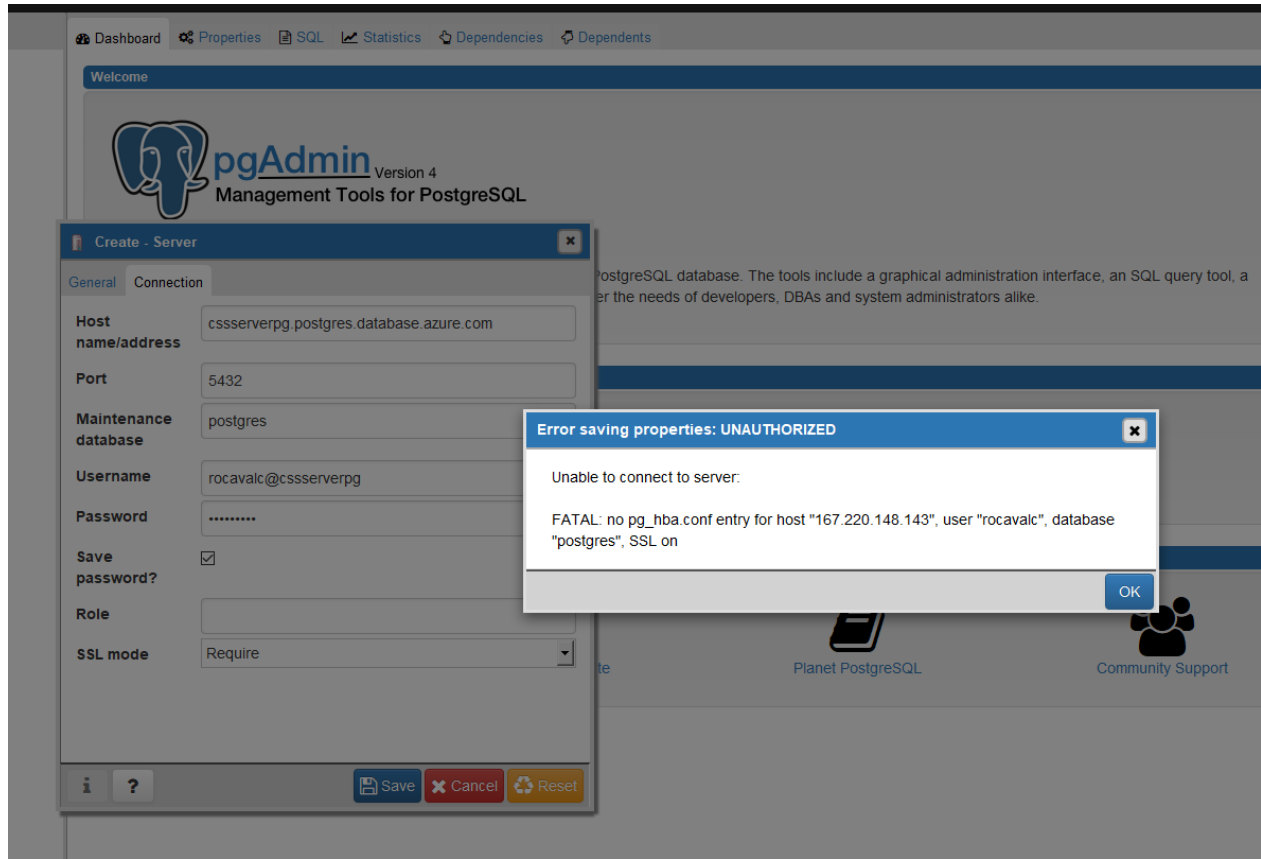

Last updated by | Abhishek Reddy Kumbham | Jun 3, 2022 at 1:49 PM PDT

## PostgreSQL setup firewall

Differently from Azure SQL Database, in PostgreSQL the blade with the Firewall IP information can be found under "Connection security" on the server blade.

The screenshot shows the Microsoft Azure portal interface for a PostgreSQL server. The left sidebar contains a 'SETTINGS' section with 'Connection security' highlighted. The main content area is titled 'Connection security' and includes a 'Save' button, a 'Discard' button, and an 'Add My IP' button. Below these are 'SSL settings' and 'Firewall rules' sections. The 'Firewall rules' section contains a table with columns 'RULE NAME', 'START IP', and 'END IP'. A red box highlights the 'RULE NAME' column, and a red arrow points to the 'Firewall rules' section header.

RULE NAME	START IP	END IP
Allowing connections from	74.24.32.1	74.24.32.1
