Customer needs to whitelist application IP address in the Azure PostgreSQL server's firewall

The screenshot shows the Microsoft Azure portal interface for a PostgreSQL server. The left sidebar contains a navigation menu with options like Overview, Activity log, Tags, SETTINGS, Connection strings, Server parameters, Pricing tier, Properties, Locks, MONITORING, Metrics, Alert rules, and Server logs. The 'SETTINGS' section is expanded, and 'Connection security' is selected. The main content area shows the 'Connection security' settings, including 'SSL settings' and 'Firewall rules'. The 'Firewall rules' section has a red box around it and a red arrow pointing to the 'Add My IP' button. Below the 'Firewall rules' section, there is a table with the following data:

RULE NAME	START IP	END IP
ClientIPAddress_2017-4-3_23-42-53	74.24.32.1	74.24.32.1

**Missing IP address error :** "no pg\_hba.conf entry for host "

Created with Microsoft OneNote 2016.
