## Issue

You may get requests/support tickets from specific customers to whitelist chaining triggers in ADFV2.

## Background

The chaining trigger allows customers to create dependency on generic dimensions, defined by the customer. This is an advanced and complex feature that enabled it to only **Milliman** customers only.

## Recommendation

When we do get a request to enable/whitelist the chaining trigger, the CSS engineer can directly **create an ICM on Orchestration Queue, and no need for AVA.**
