## Issue

When customer is reading through the entries of the SQL Error Log like:

*[DISK\_SPACE\_TO\_RESERVE\_PROPERTY]: Property not found or failed to get the property with [80071bc9]*

## Investigation/Analysis

Like stated on [Azure SQL DB Managed Instance - sp\\_readmierrorlog](#) :

*"when you look at the MI error log, you may be surprised by the large volume of messages. For example, in the first minute after instance startup, more than 2500 messages are logged. While some of them are the familiar messages you would find in a SQL Server error log, many others might look a bit cryptic, and are not actionable from an end-user standpoint."*

*"Why is all this information in the MI error log? This diagnostic data is needed for Microsoft engineers to manage the service and troubleshoot any problems efficiently."*

## Mitigation

Advise customer to use [sp\\_readmierrorlog](#) .

This will help the customer in filtering out relevant messages from the error log.
