

How to check Trace logs for trigger rerun that failed with InternalServerError

Last updated by | Graziani Orcai | Jan 17, 2022 at 8:00 AM PST

Issue

Customer tried to rerun a failed TumblingWindow Trigger run and got InternalServerError message before generating a new trigger run id.

How to check the trace logs for this scenario:

```
ApiOperationEvent
| where env_time >= datetime(2022-01-11 07:25) and env_time < datetime(2022-01-11 08:35:00) //Data range of wh
| where DataFactoryName =~ "adfname" //ADF name
| where operationName == "POST Trigger/RerunTriggerRunAsync" //This is operation for rerun, but you could use
| where RequestUri has "triggername" //Trigger name
| where resultType == "Failure" //This is looking for only failures, you can take off this filter to see all s
| project env_time, operationName, DataFactoryName, RequestUri, resultType, resultSignature, TraceCorrelationI
```

After getting the TraceCorrelationId from the failed request in the result of above query, you can run the following query to see the trace logs:

```
AdfTraceEvent
| where env_time >= datetime(2022-01-11 07:25) and env_time < datetime(2022-01-11 08:35:00) //Data range of th
| where TraceCorrelationId == "tracecorrelationid" //TraceCorrelationId from above query result
| project ComponentId ,env_cloud_role, env_time, Message , TraceCorrelationId
```

You will see all trace logs for the Trigger run failure, even though it failed before generating a Trigger Run Id.
