Issue

When customer login Azure Data Factory portal to build the dataflow activity, he/she may meet the issue: snowflake cannot be selected and used as source or sink in the activity.

Root Cause

We have one bug in Azure Data Factory backend which lead to the customer must need higher permission if he/she wants to use dataflow new released connectivity (for example, Snowflake, AzureMySQL, PostgreSQL...). Related bug-fix is ongoing and will take effective after serval weeks.

Resolution

When customer meets up issue, please ask him/her to use one of following solutions to work around it:

1. The customer should have Azure Data Factory contributor role or higher. If he/she is custom role, the customer needs to add "Microsoft.DataFactory/factories/queryFeaturesValue/action" permission.
2. The customer can use UX feature flag, for example: <https://ms-adf.azure.com?feature.enableSnowflakeInDataflow=true>
