Issue

With T61 comes support for new connectors (abs:// for Azure Blob Storage and adls:// for Azure Delta Lake Storage) and after T62 customers will be able to create external data sources with generic type (when no type is specified) only if they use new connectors. So, if for example they try creating external data source with generic type and http[s] prefix:

```
CREATE EXTERNAL DATA SOURCE EDSName  
WITH (  
LOCATION = 'https://ftpcuswasbstd1.blob.core.windows.net/testdata-public')
```

they would get the following error:

Msg 46548, Level 16, State 1, Line 688

'<https://ftpcuswasbstd1.blob.core.windows.net/testdata-public> ' contains an unsupported prefix. Retry with supported connector prefix.

Mitigation

For this case mitigation would be to use new connectors instead of https, so location specified in external data source would be: **abs://testdata-public@ftpcuswasbstd1.blob.core.windows.net**

Root Cause Classification

Cases resolved by this TSG should be coded to the following root cause:
(TBD)
