## Summary

Customer receives an error stating that the sas uri is not valid.

## Possible causes for issues

This is a known bug with version 3.12.0 of the Az.Storage Powershell module. Verify whether the customer is using that version by running

Get-Module Az.Storage

ModuleType	Version	PreRelease Name	ExportedCommands
Script	3.12.0	Az.Storage	{Add-AzRmStorageContainerLegalHold, Add-AzStorageAccountManagementPolicyAction, Add...

If the customer is using this version, have them downgrade to 3.11.0. To do this, run the following steps:

1. Uninstall-Module Az.Storage
2. Close the Powershell session and start a new one
3. Install-Module Az.Storage -RequiredVersion 3.11.0

If the version is already 3.11.0, then the most likely cause is the sas url is invalid.
