Problem description

Slow performance when migrating data between two ADLS Gen1 accounts

Root cause/ Resolution

For the following run's ~30 MB/S throughput, we have noticed that MGM has limited the source and sink "maxConcurrentConnections" as 32, and also limited "parallelCopies" as 32. This was causing the performance Neck. So we suggested to remove those settings, and only tune DIUs only for better perf. besides the "parallelCopies", please also leave source/sink "maxConcurrentConnections" as empty.
