## Enhanced Dataset

Tuesday, April 30, 2019

14:21

Recently, we enhanced some of ADF datasets

- SQL family datasets
  - Azure SQL database
  - Azure SQL Data Warehouse
  - SQL Server
  - Azure SQL Database Managed Instance
- Parquet dataset (newly added)
- Delimited Text dataset (newly added)

All newly created datasets of above 6 types will go through new logic at backend.

In case the 6 enhanced datasets have some issues blocking customers, below are the steps to switch back to original logic.

### SQL family datasets

1. Open the dataset on UI, and click "Code" on the upper right corner.
2. Remove the entire "schema" JSON array, which looks like

```
"schema": [  
  ...  
]
```

3. Click "Finish" on the bottom right corner.
4. Then the dataset will behave as before.

### Parquet and Delimited Text

1. On UI, create another **JSON** dataset with same linked service.
2. In the "Connection" tab of the JSON dataset, change "File format" from JSON to Parquet/Text format.
3. Fill in other necessary settings that customers want.
4. The newly created Parquet/Text changed from JSON will behave as before.

Created with Microsoft OneNote 2016.
