Issue

When to Publish in master branch from ADF portal, customer is receiving the following error:

"Error while publishing: Cannot read property 'tableName' of undefined"

Symptoms

Customer is hitting an exception because a dataset is missing.

It seems customer modified some resources from the last time they published, so they could see the Git commit history and look for a dataset deletion/rename in the history or any recent pipeline change that is consuming the dataset. In this case, customer had deleted the Office 365 dataset, which was causing an issue.

Investigation

Please work with the customer and check the commit history in the repo to see the latest changes since the last publish operation, and identify/isolate the pipeline referencing the dataset that was modified recently, or any dataset rename/deletion in the commit history.

Resolution

Clicking the faulty pipeline validate button should stuck it and gray it out.
