Issue

The customers may encounter a delay between updating data on Dataverse and reading it with CDM connector in Dataflow

Reason

There is a delay of around an hour between when the data is updated in Dataverse and the snapshot data withing each entity is updated. CDM model or manifest points to these snapshot files for each of these entities under partition paths. As a result trying to read this data too soon might not show the recently added data.

<https://docs.microsoft.com/en-us/powerapps/maker/data-platform/azure-synapse-link-data-lake#continuous-snapshot-updates> 

Recommendation

There needs to be more delay added between when Dataverse is updated and Dataflow is executed. Please reach out to Dataverse team to know more on the correct approach and if there are alternatives
