

Access similar ADF portal experience from external customers

Last updated by | Jackie Huang | Jan 4, 2022 at 12:24 AM PST

We control ADF new features in two different ways in order to be available for external customers:

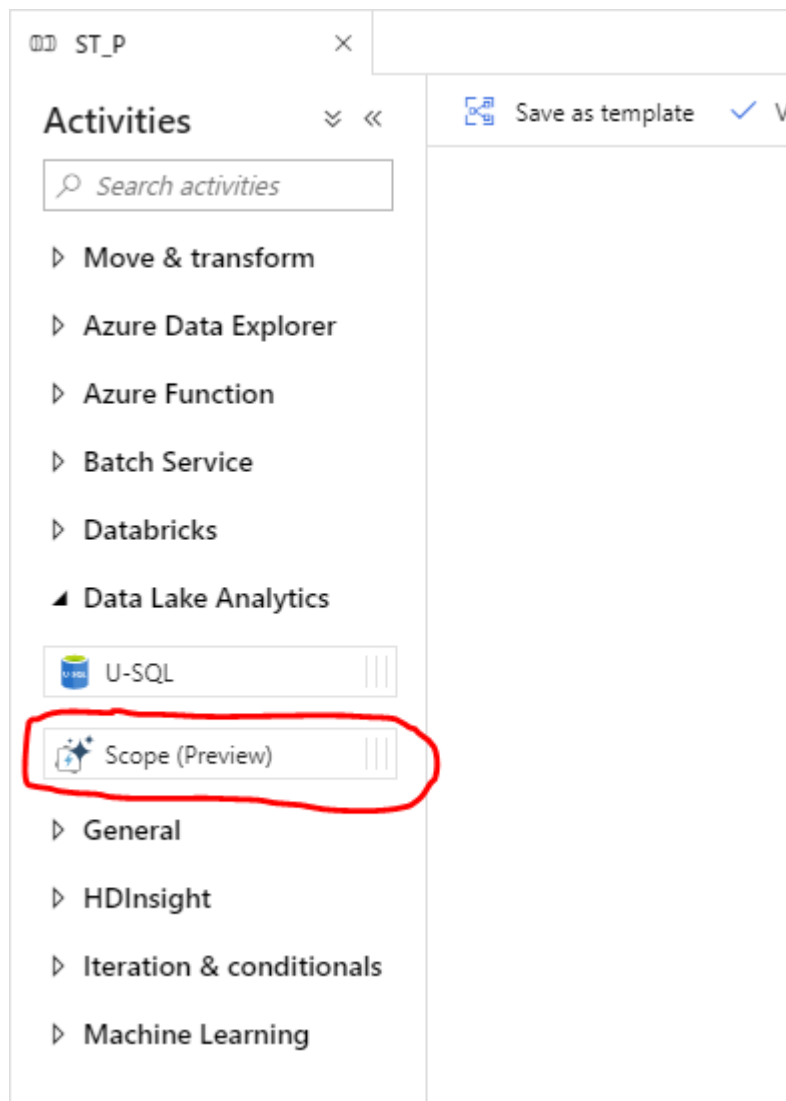

Feature Flag

There are some new features that are released first for Microsoft internals and later for customers controlled by URL query string.

In order to have similar experience from external customers, we just need to access our Data Factory with the following URL: <https://adf.azure.com/datafactories?feature.customportal=false> ☑

Exposure Control

There are other new features that are controlled by exposure control, which controls functionalities from the backend by whitelisting subscriptions. For instance, Scope Activity is available only for internal Microsoft subscriptions (external customer cannot use this feature):

How good have you found this content?
