## Issue

Fetch the data from SLT system ( connected to ECC as source) & trying to pull the data using SAP CDC connector, we already have some of the tables from ECC being replicated via SLT to on premise HANA DB ( 1: N replications) feed going to 2 separate HANA DB. Now want the same table from source ECC ex: KNVK table to get to Azure data lake using CDC connector using this ODP. Any table not replicated earlier across SLT system works fine but if any of these tables are replicated in any of the other connection then the replication fails ( due to triggers already existing for that table),

## Root Cause

2636663 - Inconsistent Trigger Status when replicating from same source with different client sin SLT

## Resolution

Please confirm you extract data from different clients in the same system
