Network Trace

Monday, November 11, 2019
11:30 AM

1. Open an elevated command prompt and run: "netsh trace start capture=yes tracefile=c:\temp\nettrace-boot.etl" (make sure you have a \temp directory or choose another location).
2. Reproduce the issue or do a reboot if you are tracing a slow boot scenario.
3. Open an elevated command prompt and run: "netsh trace stop"

Your trace will be stored in c:\temp\nettrace-boot.etl**or where ever you saved it. You can view the trace on another machine using netmon.

Created with Microsoft OneNote 2016.
