Contents

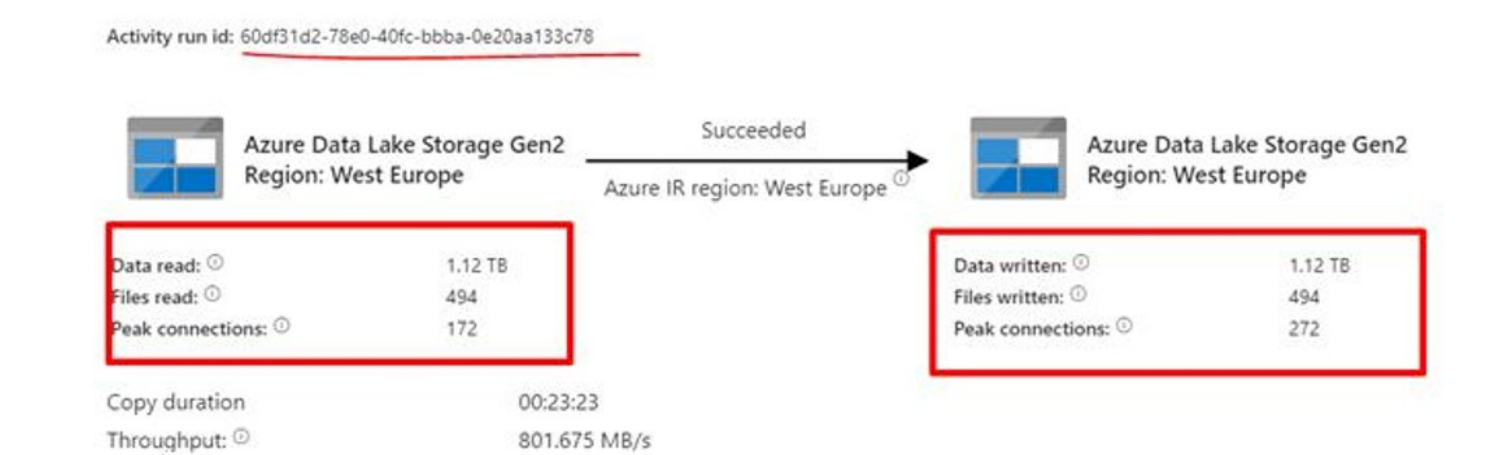

- Summary
 - Parquet file copy
 - CSV file copy
- Expectation from customer
- Recomendatation

Summary

Customer would like to see the number of rows copy when using Parquet. Is there anything on the road map?

Parquet file copy

- ☐
- When copying parquet file, we cannot see how many rows read and wrtten to sink.

CSV file copy

- ☐
- When copying CSV files, we can see how many rows read and written successfully.

Expectation from customer

1. Customer would like to see the number of rows copy when using Parquet file copy as well.

Recomendatation

1. This request from customers would dramatically reduce performance. The reason why it copies so fast is because it's optimized to use a binary copy instead of reading/writing row by row.
2. How to check if the copy is taking the advantage of binary copy.

```
CustomLogEvent  
| where ActivityId == <activityId> and Message has "DirectBinaryCopy"
```

Then check if the value of DirectBinaryCopy is true
