SME	
Symptoms	Some column are missing in column mapping for Cosmos DB source.
Cause	ADF scans first 10 documents to detect the schema of json file, so if there is no value for some column/properties in those documents, ADF cannot not detect it and then use it in column mapping.
Resolution	<p>To resolve this:</p> <p>we need to make sure those columns that may not contain any value in the first 10 rows have value, and we can tune the query as below: (assume: impossible column is missing in first 10 documents)</p> <p>select c.company, c.category, c.comments, (c.impossible??) as impossible from c</p>
