AAD - Firewall Rule

FYI

eSTS IPs are subject to change without notice. We serve traffic out of multiple instance which we alternate during deployment. Additionally, as we add capacity, we add/remove IPs from each DC that serve traffic. Finally, we dynamically route traffic intended for one DC to a different DC depending on the health of the intended DC. This all leads to IPs for eSTS being highly unpredictable and not conducive to listing explicitly in a firewall exception.

If the customer really cannot allow all of login.microsoftonline.com and login.windows.net in their firewall, they should probably work with Microsoft Consulting to come up with the right architecture
