Read Replicas for PostgreSQL

Monday, December 3, 2018

12:21 PM

The following is currently implemented in this feature –

- Up to 5 read replicas, in the same region
- Ideal for read scale-out workloads e.g. BI and Analytics
- Asynchronous PostgreSQL native replication
- Stop replication capability; No promotion to cluster master
- Deleted master means standalone servers

This is a read scale out feature and not high availability, hence the replicas cannot be promoted to master. However, it gives good capability to users to scale out read workloads like BI.

Created with Microsoft OneNote 2016.
