## Deprovisioning

When a DB is removed from a sync group in the normal fashion, it is deprovisioned so that all the sync metadata is cleaned up from the database. However, if the deprovision fails for any reason, an error status on the db is displayed that this DB failed to be removed from the sync group. You can fix the issue that stopped the DB from being deprovisioned and try again. If the reason is unknown, you can manually deprovision by using deprovisioningutil.exe that is installed when you install an agent.

Default path: C:\Program Files (x86)\Microsoft SQL Data Sync 2.0\bin

Usage:

Deprovisioningutil "server=(local); databse= < dbname >; Trusted\_Connection=True

Deprovisioningutil "Server=tcp:sever.database.windows.net; Database=dbname; User ID= UID; Password =...; Trusted\_Connection=False"; /f

/f: deprovision without warning
