## Telemetry - Kusto Query to identify Named replicas

```
MonBillingVldbStatus2
| where PreciseTimeStamp > ago(7d)
| where page_server_count == 0
| summarize by primary_ServerName=primary_logical_server_name, primary_DBId=primary_logical_database_id, nr_Se
| join kind=leftouter (MonBillingVldbStatus2) on $left.primary_ServerName == $right.billing_server_name, $left
| project ClusterName, billing_subscription_id, primary_ServerName, primary_DBName=database_name, primary_DBId
| distinct ClusterName, billing_subscription_id, primary_ServerName, primary_DBName, primary_DBId, service_lev
```
