- [Investigation](#)

Issue

User getting the following error while executing data flow:

```
"ErrorCode":3904,"Message":"Dataflow execution failed due to User Configuration Error."
```

Investigation

Query the **CustomEventLog** table to get the detailed error from the databricks cluster for the job failure:

```
cluster('Azuredmprod').database('AzureDataMovement').CustomLogEvent
| where PreciseTimeStamp >= ago(30d)
| where Message has "innerExecutionError" and ActivityId == "<ActivityRunId"
| project PreciseTimeStamp, Role, TraceMessage, Message, EventName, TraceComponent, StatusCode, SubscriptionId
| sort by PreciseTimeStamp asc
```

The job can fail for multiple reasons, eg. datatype mismatch, unsupported datatype, issues with the source data or some misconfiguration by the user. Check the error stack for potential issues.

If you need to engage SME/PG, please ask customer for [support files](#) and sample data (if possible).
