## Issue

Web Activity failing with the following error: *Error 2108 Error calling the endpoint*

## Symptom

When users try to use web activity in Azure data factory to connect to an **internal URL** (hosted on their company Intranet) they will receive below error message

```
{
  "errorCode": "2108",
  "message": "Error calling the endpoint. Response status code: ",
  "failureType": "UserError",
  "target": "Web1"
}
```

## Investigation

Query Kusto logs for the web activity run id:

```
cluster('azuredmprod.kusto.windows.net').database('AzureDataMovement').CustomLogEvent
| where ActivityId == "{activityId}"
```

Check the logs where TraceMessage="WebActivityExecutorDetailTrace"

If you see a log like this:

```
<LogProperties><Text>WebActivityInvoker WriteAsync - completed invoking endpoint. - - returned
statusCode {%}</Text></LogProperties>
```

- It means that the activity called the endpoint and received a response. If it failed, it is due to the endpoint returning an error.

- If the endpoint is being hosted by the customer (ex. Web service), he needs to check the service logs to investigate further.
- If the endpoint is a Azure service (APIM, AKV, SSIS, etc), file a ticket with their on-call team.

## Resolution

CSS Engineers may help end customers with below steps to identify if they are targeting an **internal** endpoint

- Is the URL accessible from open internet(when customer device not connected to his company network)?
- Customer should use Self-Hosted IR to connect to the endpoint. The web service endpoint should be accessible from the Self-Hosted IR machine.
- If the error states: *An error occurred while sending the request.'. No response from the endpoint. Possible causes: network connectivity, DNS failure, server certificate validation or timeout.*

It is most likely a network issue. Ask customer to retry. If retrying works, the best way to resolve transient network issues is with retry logic.
