Issue

When customer attempt to update the connection policy from Azure Portal or from other tools. The policy change request will fail.

Error

Cause

When the connection policy for the logical server is changed, it's applied to all the databases under the logical server. If any of the database is in paused/deactivated state, the update gets stuck. This is a known issue and is being tracked in the attached repair item. Workaround is to disable auto-pause or keep the databases active by running a minimal query every 30mins.

<INTERNAL ONLY> If a db is deactivated, it will try to go to master to add or remove a sys.databases row. We do not need to do that for updating proxy override since we only care about updating the alias.
