Troubleshoot PITR (Point In Time Restore) issues

Thursday, October 24, 2019 6:43 PM

Check ASC restore tab

ASC Restore

You can also check in MonManagement view in KUSTO. The sample query could be

MonManagement

| where request_id == "{subscriptionid}"

| order by originalEventTimestamp asc
| project originalEventTimestamp, NodeName, event, ['state'], fsm_event, caller_state_machine_type,
state_machine_type, exception_type, old_state, new_state, error_message, operation_type, exception, error,
error_classification, error_code, error_message_format, error_number, stack_trace, elastic_server_name, operation_parameters

Then you can check if any errors or if stuck at any state, e.g. the screenshot below

Created with Microsoft OneNote 2016.
