Automate Backups - How often procedures are tested

- Disaster drills occur quarterly – simulation of full region outage and verification of recovery procedures for that.

- Backups occur continuously on all databases. Automated monitoring of telemetry is in place to verify that backups have successfully completed.

- Restores occur continuously as initiated by customers. Automated monitoring of telemetry is in place to verify that restores successfully complete.

- (following is not yet true but will be in 3-4 months) all DBs have their backups restored in the background (no charge to customers) at some frequency and consistency checks are run on the restored database.

- Backup files are stored both in the same region and in another region in the same geography. (eg DB in JapanEast, backups are in JapanEast and JapanWest).
