- Common Issues

Intro

Customers can create or drop databases using:

- CLI ↗
- create database statement ↗

Common Issues

- user does not have permissions to create database.
  You can check user permissions by running:
  ```
  select * from pg_user where usecreatedb='t';
  ```
  if user is not in above output, login as server admin and run:
  ```
  alter user USER_NAME with createdb;
  ```
- Create database taking long time. Create database will initiate checkpoint, which if it was taking long time will cause this issue, check this TSG for more info.
- Database creation failed due to `ERROR: invalid locale name`.
  Customer is using invalid collation to create his database, you can check if available collation using:
  ```
  select * from pg_collation;
  ```
