Issue

When customer uses Azure SQL Database/Azure Synapse Analytics as source in dataflow (preview data, debug/trigger run...). And customer want to apply pre-SQLs/ post-SQLs before/after reading data from Source table/ query.

Root Cause

Currently dataflow do not support pre-SQLs, post-SQLs in Source. And we also don't have plan to support it.

Resolution

As a workaround, customer can switch to query mode and put both pre-scripts and select statement in query text box. However notice that if the pre-sqls are related transaction, it may not work, then there is no workaround.
