Issue

Blob Trigger doesn't execute when using Storage Object replication policy to sync container A with container B.

Customer use a very special method called Object replication policy to sync container A with container B, and he has a blob event trigger which subscribe to container B. Every time customer drop a file to container A, there will be a file created at container B. But there is no events generate at container B. So the block event trigger didn't fire.

https://docs.microsoft.com/en-us/azure/storage/blobs/object-replication-overview ☒

Resolution

This is by design behavior as sync with Storage team. Kindly engage Storage team for further suggestions to generate an event whenever file is synced using Object replication policy.
