Symptom

Triggers are missing or disabled

"WARNING: Trigger {triggerName} IS MISSING!"

"WARNING: Trigger {triggerName} exists but is DISABLED!"

Action plan

Since we are missing the triggers for almost all the tables I feel that re-creating the sync group will be the best option since we already lost some of the changes made in the source.

You can apply the following action plan:

1. Stop the sync or wait for it to complete
2. Remove the sync group and wait for the deprovisioning to complete
3. (optional) Truncate the destination tables
4. Re-create the sync group

Please note that step 3 is optional, truncate all the tables for the sync group in the destination, this will speed up the initial sync a lot, if you have data on both sides during initial sync, it can take hours, days or weeks to complete.

Classification

Root cause Tree - DataSync/User issue/error/SyncFail
