## Issue

Customers may experience the below warning while trying to preview the data in Sink (SQL).

'At least one incoming column is mapped to a column in the sink dataset schema with a conflicting type, which can cause NULL values or runtime errors.'

## Reason

This is a warning about Datatype conversion, saying that there can be null values while writing to the SQL table.

## Recommendation:

While Data previewing nothing will be written to the SQL table, so you won't see any issue there. In this case, ask the user to run the Dataflow in a pipeline and then see if the customer gets the expected results, if there are nulls in the data, the customer needs to fix his logic as per warning.
