Issue

Geo-Replication: The customer wants a user to have access to only the secondary replica or a user database and No access to the primary database.

Recommendation/Steps

Steps to achieve this as follows

On Primary Server:

Logical Master Database:

- Create login [new_user] from external_provider
- Alter login [new_user] Disable

Primary User DB:

- Create user [new_user] from Login [new_user]

This user is replicated from the primary db to the replica(GeoDr replica that customer has setup)

Secondary:

Logical Master DB:

- Create login [new_user] from external_provider

The user will now be able to access only the secondary replica of the user db and no access to the primary database.

RCA Template (optional)

TBD

Public Doc Reference (optional)
