[SharePointOnlineList Name Mapping]

Last updated by | Jackie Huang | Jan 4, 2022 at 12:24 AM PST

Symptoms

The list name in SharePointOnlineList Connector are not exactly same as name in SharePoint Online site.

Resolution

SharePointOnlineList Connector use SharePointOnline odata endpoint to get the lists, if the name in SharePoint Online site has special characters in one or more of these (~`!@#$%^&*()+-=|[]{};':,./<>?"), then the name will be different, the mapping rules are:

1. Remove all spaces and special characters except for "_", special characters includes (~`!@#$%^&*()+-=|[]{};':,./<>?")
2. Capitalize the first letter of each word which split by space and special characters
3. List name is case sensitive
4. If the first letter is number or "_", add "C_" before the name
5. After applying above rules, if there are same list name in the site, add sequence number (0,1,2...) at the end of the name

Example:

List name in SPO Site	List name in SPO Connector
abc's list	AbcsList
0abc!@#$%^def	C_0abcDef
_~`0!@#$%!^&*()_+-=|[]{};':,./<>?""012金大福3456789_쳐우리는	C__0_012金大福3456789_쳐우리는
